1. Introduction

The screenshot shows the RISKSHIELD dashboard interface. At the top, there is a navigation bar with the RISKSHIELD logo, documentation links, and a search bar labeled "GB50_SHOWRO...". Below the navigation bar is a header titled "ML OPS" with tabs for "Sources", "Datasets", "Supervised", "Unsupervised", "Predictions", and "Tasks". The "Sources" tab is selected. The main area is a table titled "Sources" with columns for "Type", "Name", "Last modified", "Size", and "Actions". The table lists eight CSV files named "RSML_2019-12" through "RSML_2019-05", each containing 526 fields (9 categorical, 517 numeric). The last modified time ranges from 1h 31min to 5h 47min, and sizes range from 12.8 MB to 46.8 MB.

Type	Name	Last modified	Size	Actions
CSV	RSML_2019-12	1h 31min	12.8 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-11	2h 23min	20.5 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-10	2h 44min	27.2 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-09	3h 10min	31.6 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-08	4h 33min	34.7 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-07	4h 56min	46.8 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-06	5h 30min	33.5 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]
CSV	RSML_2019-05	5h 47min	28.6 MB	[Edit] [Delete] [Search] [Cloud] [WhizzML]

Picture 1: General RISKSHIELD Dashboard layout in terms of sources.

Phishing and pharming are crucial cyber security threats for the customers of any bank. RISKSHIELD is the fraud detection software solution operated by SIA in partnership with INFORM GmbH. RISKSHIELD analyzes, monitors and keeps profiles of the multidimensional data that has been used in banking transactions. For instance, it checks which (unfamiliar) IP address was used for a specific transaction. How were the mouse clicks during the transaction. Is it me or someone else executing the transaction i.e. keeping a profile of the username. Furthermore, is the amount of money spent the usual? RISKSHIELD has been developed predominantly in the years 1999 to 2010 [4]. It is primarily used in the industries of payments/banking, insurance and air cargo. RISKSHIELD is a real time fraud and anti money laundering solution. It combats cyber attacks by applying Machine learning techniques in combination with fuzzy logic on big production data(sets). Its dashboard interface provides the user with comprehensive reports so that management can act promptly. The results of models are highly interpretable due to the simple interactive visualizations. Therefore, it can detect suspicious activity in terms of fraud, money laundering and terrorism financing [1]. RISKSHIELD responses occur within milliseconds, namely up to 4,100 single assessments per second. RISKSHIELD operates 24/7 via sets of specific rules which are specific to the application domain of the user (Rule editor + Application Center). Other properties of RISKSHIELD are multi-channelling and supervised learning techniques. RISKSHIELD is eager to identify for instance the probability of payment default. INFORM and BigML have recognized great synergies and work together, resulting in an Hybrid Artificial Intelligence approach via RISKSHIELD. The INFORM GmbH software analyzes large amounts of data in a matter of seconds, calculates numerous decision variants and finally suggests the best possible (model) solution to the user. RISKSHIELD uses a PMML interface. Furthermore, it has standard XML, CSV and JMS interfaces. It supports a highly secure PCI-DSS implementation and is not dependent on external support [4]. While some consider RISKSHIELD's

interface a bit dated and cumbersome, potential alternatives to RISKSHIELD are Feedzai and IBM Security Trusteer Pinpoint Malware Detection Advanced Edition, Signified, SEON. Fraud Fighters, Riskified, ClearSale, Sift, NoFraud, CertifID, Kount, TruValidate and DataDome. RISKSHIELD is useful also in the insurance industry where not each possible fraudulent claim can be reviewed individually. RISKSHIELD can separate between legitimate claims and suspicious claims which deserve further attention by law professionals. Hereby, incriminating and exonerating (semantic) indicators are taken into account, formulated into a linguistic if-then context, resulting in an individual risk score [4]. Finally, RISKSHIELD is also able to identify suspicious items of freight next to already implemented systems such as X-ray checks in terms of cargo [4]. RISKSHIELD's white-box approach enables transparency, crucial for risk decisions, even under the veil of black-box machine learning techniques. Frauds are not static but entail an adversarial nature which this technology constantly progresses.

2.The Company INFORM GmbH:

INFORM GmbH is a leader in advanced optimization software and was founded in 1969. The company stands for Digital Decision Making [6]. The company is situated in the West of Germany. As of 2021 it has an annual turnover of 101 million euro [3]. The company was founded in 1969 by Hans-Jürgen Zimmermann, then Head of the Chair for Operations Research (OR) at RWTH Aachen University, with the goal of proving "that process and planning research is not a pure mathematical brainchild, but useful." Nowadays, the company is managed by Adrian Weiler, Jörg Herbers, Matthias Berlit and Peter Frerichs:

Picture 2: The Executive Board of INFORM GmbH.

The company's activities focus on the development of software systems for intelligent optimization of business processes based on operations research and artificial intelligence. The systems are used worldwide at companies in industry, trade, airports, ports, logistics, banks and insurance companies, including airlines such as Lufthansa and Delta Airlines, major shipyards, international banks, car manufacturers such as BMW, the drugstore chain Rossmann and chocolate manufacturer Lindt. In these industries, INFORM's systems optimize processes such as sales planning, production planning, workforce scheduling, [3] logistics and transport, [4] inventories, supply chain management, fraud prevention for insurance companies and payment transactions (RISKSHIELD). Another dozen INFORM employees work in Atlanta, USA, and half a dozen in Sydney. INFORM also operates two offices in Frankfurt at the airport and in Hechingen near Stuttgart.

In the meantime, not only 220 medium-sized machine manufacturers rely on INFORM's customized solutions, but also 1,000 customers worldwide from a wide range of the aforementioned industries. Optimized - and on a daily basis - are ground handling at more than 165 airports worldwide, the handling of 50,000 containers in terminals, parcel centers and logistics hubs, the scheduling of more than 5.2 million containers and returnable transport packaging in the food sector, the planning of more than six million shifts for over 200,000 employees. Specifically the protection of more than 70 million bank and mobile phone accounts via RISKSHIELD and other software is vital for INFORM. The software from Aachen is now in use in 40 countries. INFORM has more than 900 software engineers, data analysts and consultants out of 30 nations. INFORM is independent of outside investors and states that its primary corporate objective is sustainability. BigML is a partner of INFORM and corroborates for RISKSHIELD.

Picture 3: INFORM GmbH Campus, corporate headquarters in Aachen, Germany (#worldofinform)

3. Capabilities of RISKSHIELD

3.1 Rules

In RISKSHIELD, rules can be built in an arbitrary manner. In Picture 4 above below a rule is depicted which declines a transaction if it is above 100 Euro at the ATM in the form of a mastripe. In Picture 4 below the rule is edited:

The screenshot shows the RISKSHIELD Rule Management interface with two windows side-by-side.

Original Rule (Top Window):

- Header:** Rule Management, Rules, Issuing Rules v3+, Configuration, Administration, Issuing Demo, Admin.
- Left Sidebar:** Rules, Simulation, Publishing.
- Table:**

Rank	Name	Status
1	Decline Fallback	✗
2	Possible Test Transaction	✗ ⚠
3	High Magstripe ATM	✗ ⚠
4	Magstripe ATM	⚠
5	High Amount in Risk Country	⚠
- Buttons:** + NEW RULE, EDIT, DEACTIVATE, DELETE.
- Text:** Created: 2020-02-10 by System, Modified: yesterday by Admin , Rule-ID: 954
- Title:** High Magstripe ATM
- Conditions:**
 - Amount > 100 EUR
 - MCC is 'ATM'
 - POS Entry Mode is 'Contactless Magstripe', 'Magstripe', 'Magstripe unreliable CVV'
- Actions:**
 - Action: ✗ decline
 - Alert: ⚠ Create Case

The screenshot shows the RISKSHIELD Rule Management interface with the second window (the edited rule).

- Header:** Rule Management, Rules, Issuing Rules v3+, Configuration, Administration, Issuing Demo, Admin.
- Left Sidebar:** Rules, Simulation, Publishing.
- Table:** Same as the original rule.
- Buttons:** X CANCEL, ✓ SAVE.
- Text:** Created: 2020-02-10 by System, Modified: yesterday by Admin , Rule-ID: 954
- Title:** High Magstripe ATM
- Description:** (empty)
- Conditions:**
 - Amount = ≠ < ≤ > ≥ ∈ € 100 EUR x
 - MCC is not ATM x
 - POS Entry Mode is not Contactless Magstripe x Magstripe x Magstripe unreliable CVV x
- Actions:**
 - Action: ✗ decline x
 - Alert: ⚠ Create Case x
- Buttons:** + NEW CONDITION, + NEW ACTION.
- Scores:** (empty)
- Buttons:** + NEW SCORE.

Picture 4: Change of a rule (below). Original rule (above): from >100 of an ATM if it is Magstripe results in a decline (action) and an alert case for the fraud expert.

Case Management alerts provide messages based on the transactions which trigger suspicious activity by for instance violating the aforementioned rules (Picture 5). RISKSHIELD allows to track suspicious transactions, based on the debit card's history (Picture 6 below). Once payment has been deferred from RiskShield via a warning or an alert, the case investigation end user will have time to access the alert data, review all the data displayed, switch the view from the account level to the customer or beneficiary level, and to review the profiles and statistical review Data. This helps to get an overview of the overall situation [4]. Further actions are involved in such a case. Ergo, RISKSHIELD is able to capture dynamic behavior of customers [4].

The screenshot displays two views of the Case Management system.

Top View (List of Alerts):

Event Id	State	Assignee	Created By	Create Date	Close Date	Follow Up Date	Modified By	Modified Date	Importance	Event Class
2,201	In Progress	Admin	\$Admin	2020-02-11 13:39...			Admin	2020-10-23 10:19...	100	SuspiciousActivity
2,202	In Progress	Admin	\$Admin	2020-02-11 13:39...			Admin	2020-10-23 11:11...	95	SuspiciousActivity

Bottom View (Case Overview):

This view shows a detailed alert for event ID 2251. The sidebar includes links for Case Overview, Card Data, Transaction History, and Previous Cases of Card (with a cursor icon).

- Alert:** Unusually many transactions per day. Several ATMs in short time period, Risk PoSEntryMode, Risk Country
- Case Details:**
 - RISKSHIELD SCORE: 80
 - Case Class: SuspiciousActivity
 - Status: In Progress
 - Assigned To: Max Mustermann
 - # Alerted Transactions: 1
 - Case ID: 2251
 - Generated: 2020-03-05 15:09:13
 - Follow Up Date: Cleared
- Case Activity Log:** Shows three log entries:
 - 2020-10-23 10:25:11: Admin executed action "Soft Block and Notify" in "Card Information".
 - 2020-10-23 10:25:05: Admin executed action "Show clear PAN" in "Card Information".
 - 2020-10-23 10:24:50: (no description)
- Actions:** Buttons for Show clear PAN, Soft Block and Notify, and Block and Replace. PAN: 4549 87XX XXXX 6643. Card ID: B/JY57IKUJUxkqZlG4cmWoj50Oh2b4D1f6XTeEwkM9k=.
- Alerted Transaction:**
 - RS Score: 80
 - Transaction Timestamp: 2019-08-19 14:00:00
 - Transaction Amount: 67.00 EUR
 - Transaction Amount: 1,000,000.00 Indonesian rupiah (IDR)
 - Terminal Country: Indonesia (IDN)
 - Merchant Name: CitiBank_Indonesia
 - MCC: ATM (6011)
- Case Comments:** No comments yet.
- Documents:** Upload button.

Picture 6: transaction history of suspicious activity.

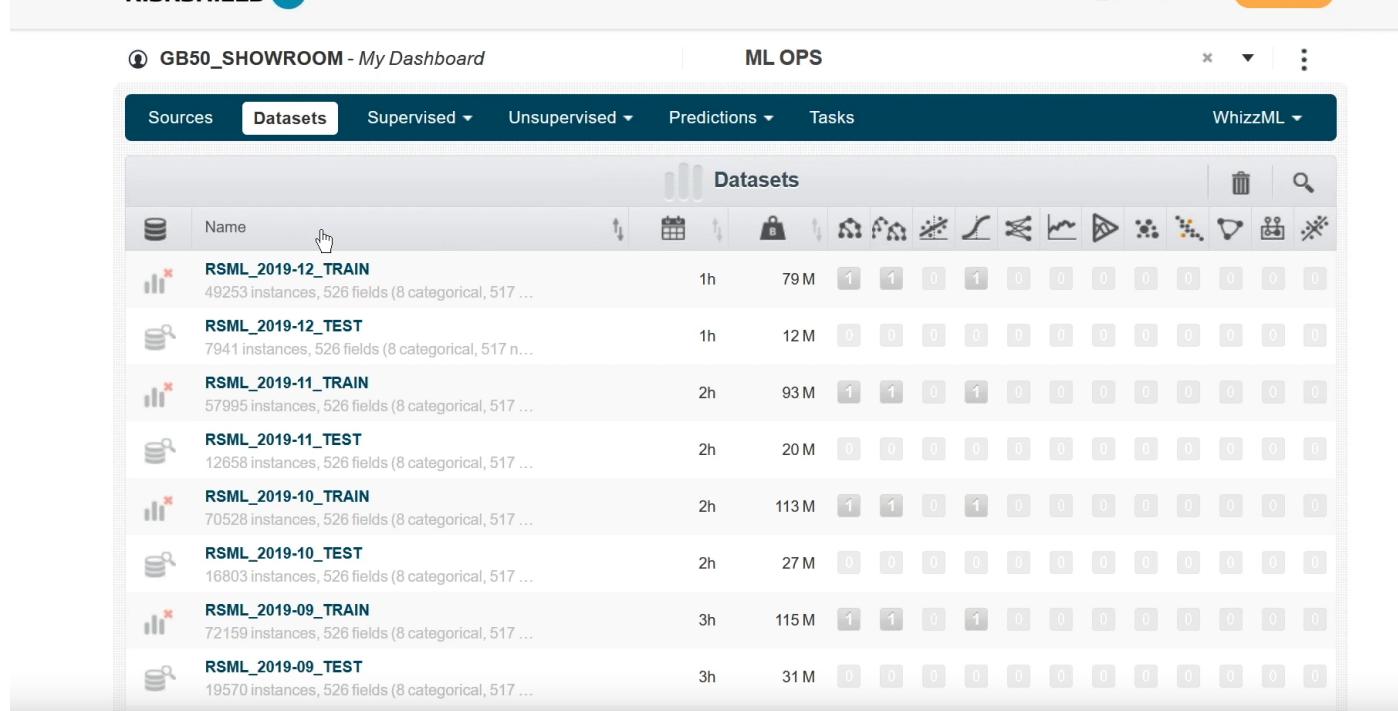

3.2 Machine Learning

Picture 7: ML process

In Machine learning data wrangling, data transformation and feature engineering require the most effort. The three consecutive steps modeling & evaluations, predictions and impact measure require solely a fraction of this effort [6]. Predicting fraud and fighting crime is crucial hereby. In a first step, within RISKSHIELD a data set can be created and for instance the field types are automatically identified (numeric, categorical, text, date-time, etc.). For details see Picture 8 (below) The data set can then also be split into training and test data.

Picture 8: Analysis of the different features (independent variables of the dataset) such as distribution, field type (above) and train & test split (below) in the Data user interface.

RISKSHIELD is a legit practical application of Fuzzy technology [4]. Modeling operators often have to rely on stiff assumptions when it comes to practical applications of Fuzzy theory. Fuzzy theory is applied since in many cases the combination of current information with dynamic patterns and histories is needed to identify critical (transaction) events. Fuzzy logic is able to represent an expert's experience, flexible, decision making, cost-effective and reliable [4]. Fuzzy c-means algorithm and possibilistic clustering allows for different degrees of membership to each class for a customer or transaction [4]. Partition coefficient and partition entropy have to be chosen (by simulation) [4]. As stated, man in the middle or man in the browser attacks are as common as phishing attacks. These attacks go far beyond aged hardware based protection offered previously for security by banks. Instead, Machine learning techniques with a predicting capability are employed. Specifically, supervised and unsupervised learning models (Picture 9 below) are applied in order to predict future transactions via the test and training data. The results of these predictions can be applied in real-life checking of transactions. Zimmermann gives an example in his paper of a fuzzy logic implied rule in RISKSHIELD: "In case of a payment from a customer account with an amount of untypical high value, an IP address from a risky region instead of the well known IP address for this account, stop payment for manual intervention" [4]. Moreover, RISKSHIELD "filters out undesired alerts down to an acceptable false-positive rate" [4] by using for instance fuzzy bounds instead of hard bounds.

Name	Description	Time	Size	Model Status	Ensemble Status	Linear Regression Status	Logistic Regression Status	Deepnet Status	Fusion Status	Time Series Status	Evaluation Status	Optimal Status
RSML_2019-10_TEST	16803 instances, 526 fields (8 categorical, 517 ...)	2h	27 M	0	0	0	0	0	0	0	0	0
RSML_2019-09_TRAIN	72159 instances, 526 fields (8 categorical, 517 ...)	3h	115 M	1	1	0	1	0	0	0	0	0
RSML_2019-09_TEST	19570 instances, 526 fields (8 categorical, 517 ...)	3h	31 M	0	0	0	0	0	0	0	0	0

Picture 9: Possible Machine Learning models from which the user can choose in the RISKSHIELD user interface.

Models compete with each other in RISKSHIELD. The internal champion challenger can be used to compare models with each other in terms of (out)performance allowing the better performing models to enter the automated production line. The following techniques are part of RISKSHIELD's model capabilities. In terms of supervised classification learning techniques we have decision trees (Picture 10 below), ensembles of decision trees, logistic regression and deepnets. Moreover, RISKSHIELD allows for an exponential smoothing time series analysis, as well as forest, boosted and other neural techniques such as clustering models, neural networks, regression models, random forest, naive bayes, data mining, fuzzy pattern trees, etc. In terms of unsupervised learning we distinguish between cluster analysis such as K-means and g-means, anomaly detection (isolation forest), association discovery, topic models (latent dirichlet allocation). Hence, instead, unsupervised learning does not work with binary labeled data but instead with clustering and anomaly detection algorithms that are used to identify suspicious activity. As stated, the different models are directly evaluated in order to assess their quality for real-time production. RISKSHIELD establishes a risk score for every transaction, leading to a potential approval, referral, decline, hold movement or hold payment of the transaction (Picture 11 below).

Picture 10: Result of a tree which depicts a path, classified as fraudulent transactions.

Case Details	Value
RISKSHIELD SCORE	80
Case Class	SuspiciousActivity
Status	In Progress
Assigned To	Max Mustermann

Picture 13: Well-performing models are fed back into the machine learning environment resulting in a real-time decision engine.

4. Conclusion

The aforementioned ML Ops cycle releases worthy machine learning models back into the production system. There will likely be a new set of challenges financial companies have to adapt to in the post COVID era as new consumer spending habits take shape [6]. ML Ops is able to capture those behaviors. The discussed successful application of (fuzzy) technology into management systems requires most importantly the acceptance of this technology by managers [4]. The CEO of INFORM GmbH predicts that "The need for algorithmic management support will continue to grow". For more information about RISKSHIELD contact iskshield@inform-software.com or + 49 2408 9456 5000. Brochures and other informative material is available after registration¹. RISKSHIELD and RISKSHIELD ML result in hybrid ML with an additional RISKSHIELD ML SCORE for every transaction (see Picture 14 below).

The screenshot shows a software interface titled 'Case Management'. The top navigation bar includes 'Case', 'Tools ▾', 'Administration', 'Issuing Demo', and 'Admin'. The main content area displays a case overview for transaction ID 454987XXXXXX6643. The 'Case Overview_v2' tab is selected. On the left, a sidebar lists 'Card Data', 'Transaction History', and 'Previous Cases of Card'. The main panel has several sections: 'Case Details' (RISKSHIELD SCORE: 80, RISKSHIELD ML SCORE: 75.0, Case Class: SuspiciousActivity, Status: In Progress, Assigned To: Max Mustermann, # Alerted Transactions: 1, Case ID: 2251, Generated: 2020-03-05 15:09:13); 'Case Activity Log' (log entries for 2020-10-23 10:25:11 and 2020-10-23 10:25:05); 'Actions' (buttons for Show clear PAN, Soft Block and Notify, Block and Replace); 'Alerted Transaction' (transaction details: RS Score: 80, Transaction Timestamp: 2019-08-19 14:00:00, Transaction Amount: 67.00 EUR, Transaction Amount: 1,000,000.00 Indonesian rupiah (IDR), Terminal Country: Indonesia (IDN), Merchant Name: CitiBank_Indonesia, MCC: ATM (6011)); 'Case Comments' (no comments yet); and 'Documents' (Upload button). A watermark for 'INFOR' is visible in the bottom right corner.

Picture 14: Notice the additional RISKSHIELD ML Score.

6. Appendix:

Auto feature Engineering aims to unveil Deep Learning hidden layer structural results. We aim to gain extensive information from the features (Picture 15 below):

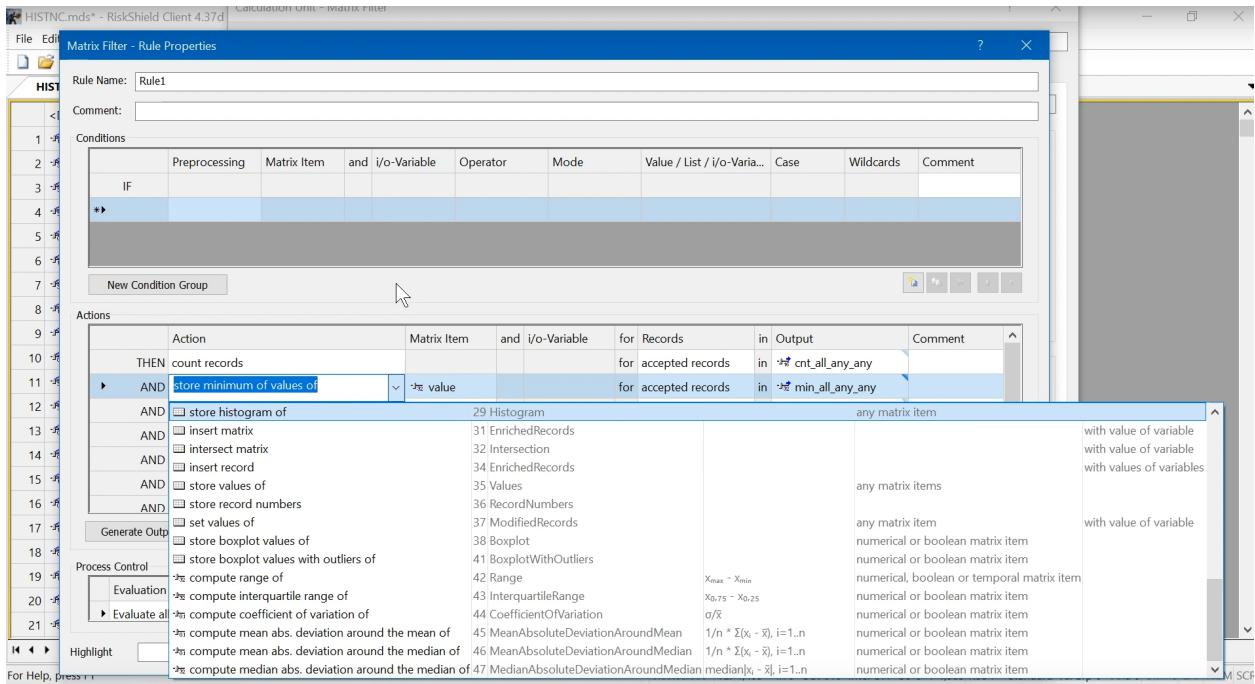

Picture 15: Split, Apply and Combine features

Alternatively, rules can be rewritten and edited in a more complex manner. The RISKSHIELD client can facilitate this (see Picture 16 below)

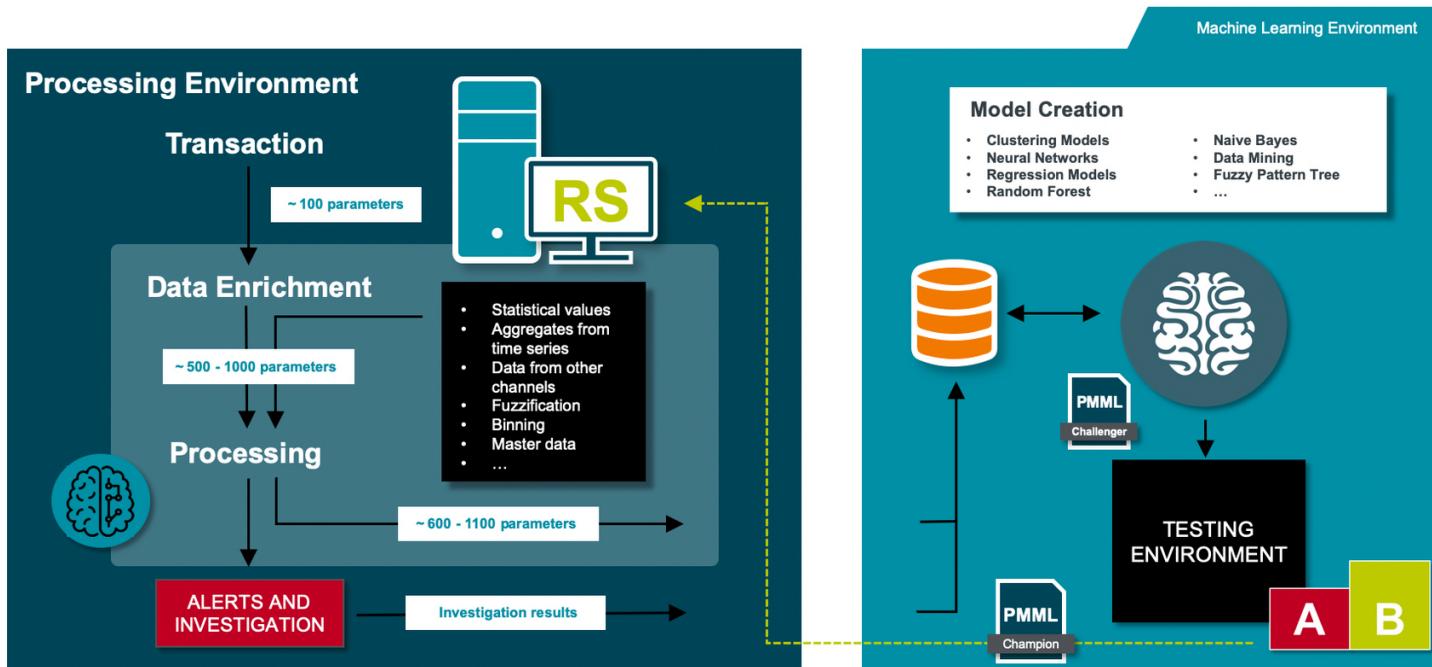

The screenshot shows the RiskShield Client interface with two main windows open:

- Matrix Filter - Rule Properties Dialog:** This dialog is titled "Matrix Filter - Rule Properties". It contains fields for "Rule Name" (set to "Rule1"), "Comment", and a "Conditions" section. The "Conditions" section has a table with columns: Preprocessing, Matrix Item, and, i/o-Variable, Operator, Mode, Value / List / i/o-Varia..., Case, Wildcards, and Comment. A single row is present with the condition "IF *#".
- Main Application Window:** The title bar says "HISTNC.mds* - RiskShield Client 4.37d". The menu bar includes File, Edit, View, Tools, Server, Window, Help. The toolbar has various icons for file operations. The main pane displays a table of rules. The table has columns: Row Number, Rule Name, Memory [KB], S, PL, T, APPLY, and COMBINE. The "APPLY" column contains functions like "cnt_all_any_any", "min_all_any_any", etc. The "COMBINE" column contains values like "1", "0", "(0)", "(0.00)", etc.

Picture 16: User benefits from rich set of futures

Riskshield ML puts theoretical machine learning models into production. RISKSHIELD ML is an auto feature engineering tool combined with an evolving machine Learning part (see Picture 17 below).

Picture 17: Processing approach of RISKSHIELD.
